Command Reference: LimitDiversionHistoricalTSMonthlyToRights()

Limit diversion historical time series (monthly) to diversion rights

StateMod Command

Version 3.09.01, 2010-02-01

The LimitDiversionHistoricalTSMonthlyToRights () command limits diversion historical time series (monthly) values to the water rights that were in effect at the time of the diversion, based on the appropriation date corresponding to water right administration numbers. For each diversion station being processed, the cumulative rights are determined at each point in time, creating a step-function in CFS units. Very junior water rights with administration numbers greater than or equal to 90000.0000 can be assigned an appropriate date, which is then used to compute an administration number for the check. The water rights must be supplied from a StateMod diversion rights file – they are not taken from rights that may be in memory and the rights used by this command cannot be further modified and written. For boundary purposes during the check, a zero flow condition is imposed at 1800-01-01 and carried forward until a right is found. A summary of the rights is printed to the log file.

This command does NOT reset recorded diversions. In order to detect recorded diversion values, StateDMI checks the command file for the

LimitDiversionHistoricalTSMonthlyToRights() command. If the command is found, then after reading data using the ReadDiversionHistoricalTSMonthlyFromHydroBase() and SetDiversionHistoricalTSMonthly() commands, each time series is copied into a backup. Any subsequent filling of the time series does not alter this backup. When limiting to rights, the backup diversion data are checked and any observed values are enforced in the result. Consequently, the rights values are only used for estimated data. A side effect of using the original data is that any values that may have been set with other commands will be reset back to observed values. If necessary, place set commands after the LimitDiversionHistoricalTSMonthlyToRights() command so that the set commands will not be impacted by the

LimitDiversionHistoricalTSMonthlyToRights() command(s).

The water rights switch in the StateMod rights file is handled as follows:

- If the switch is zero, the water right is ignored in processing (it is not used to limit the data).
- If the switch is 1, no adjustments are done to the appropriation date for the water right.
- If the switch is +YYYY (indicating that the right should turn on in the given year):
 - o If the UseOnOffDate parameter is True, the appropriation date for the water right is set to YYYY-01-01 during the limit process.
 - o If the UseOnOffDate parameter is False, the appropriation date from the administration number is used.
- If the switch is -YYYY (indicating that the right should turn off after the given year):
 - o If the UseOnOffDate parameter is True, the appropriation date for the water right is set to (YYYY+1) -01-01 and the decree is set to negative during the limit process.
 - o If the UseOnOffDate parameter is False, the appropriation date from the administration number is used.

If the administration number cannot be converted to an appropriation date, then the water right OnOff switch can be set to a year for each water right and UseOnOffDate=True should be specified.

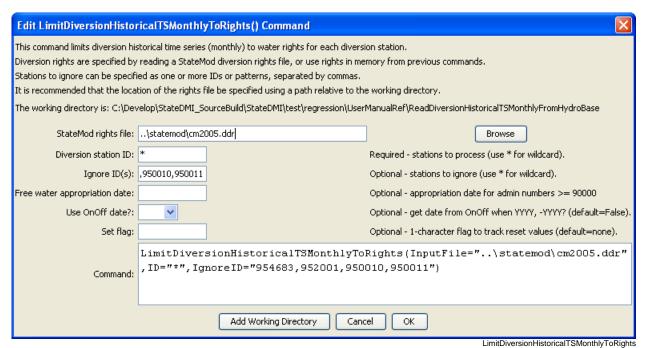

If the sum of the water rights decrees is less than zero, it is reset to zero.

A summary of the logic is as follows:

For each diversion station (ignored stations are skipped):

- 1. Determine the water rights for the diversion station. If no rights are available, skip the remaining steps.
- 2. Determine the diversion historical time series (monthly). If no time series is available, skip the remaining steps.
- 3. Process the water rights for the diversion station.
 - a. Convert the administration number to appropriation date. Use the same code as the Administration Number Calculator tool in StateView. The prior adjudication date associated with the administration number is ignored. See the explanation above for how the water rights switch is handled.
 - b. Sort the rights according to the Julian day value for the appropriation date.
 - c. If the diversion station has a free water right (those with administration numbers greater than or equal to 90000.00000): If the diversion station has a senior water right, convert the free water right appropriation date to that of the senior water right (therefore the free water right is in effect since the time of the senior right). If the diversion station has no senior water right (it has only free water right[s]), use the appropriation date corresponding to the FreeWaterAppropriationDate parameter described below.
 - d. Add a bounding zero decree for 1800-01-01 for the early period of the step function.
 - e. Generate a step function of sorted dates and decrees using the information described above. These values will be in CFS. Because appropriation dates are used, the sort order may be different from that of the numerical administration number.
 - f. Because the decrees are in CFS, convert to ACFT, considering the number of days in each month.
- 4. Constrain the monthly time series to the step function, where the step function is defined by a list of dates and decrees, determined from the previous step. If a value in the time series is greater than the step function, set the value to the step function. Because of the conversion from CSFS to ACFT, monthly values in the step function will vary.
- 5. Reset observed values from the original data (as read from HydroBase or a replacement time series read from a StateMod file time series that are NOT read from HydroBase or StateMod will NOT have a copy saved as original data).

The following dialog is used to edit the command and illustrates the syntax of the command.

LimitDiversionHistoricalTSMonthlyToRights() Command Editor

The command syntax is as follows:

LimitDiversionHistoricalTSMonthlyToRights(Parameter=Value,...)

Command Parameters

Parameter	Description	Default
ID	A single diversion station identifier to	None – must be
	match or a pattern using wildcards	specified.
	(e.g., 20*).	
InputFile	The name of the StateMod diversion	None – must be
	rights file, surrounded by double	specified.
	quotes. The rights in the file are read	
	and are used to constrain the historical	
	diversion time series. The rights are	
	assumed to be sorted by structure.	
IgnoreID	A list of diversion stations to ignore	Do not ignore any
	when processing this command. A list	diversion stations.
	of comma-separated values can be	
	specified, where each value is a single	
	identifier, or a pattern using wildcards	
	(similar to ID).	
FreeWaterAppropriationDate	A date to be used for the free water	The date
	rights found in the rights file. Free	corresponding to
	water rights are typically inserted to	an administration
	represent very junior rights. Rights	number of 0,
	having an administration number	which is Dec 31,

Parameter	Description	Default
	greater than or equal to	1849.
	90000.00000 are assumed to be free	
	water rights and will use the specified	
	free water appropriation date when	
	constraining the time series.	
UseOnOffDate	If False, the appropriation date is	False
	always computed from the	
	administration number. If True and	
	the value of the OnOff switch is YYYY	
	or -YYYY, assign the appropriation	
	date using the switch value (see notes	
	earlier in the command description).	
SetFlag	If specified as a single character, data	No flag is
	flags will be enabled for the time series	assigned.
	and each set value will be tagged with	
	the specified character. The flag can	
	then be used later to label graphs, etc.	
	The flag will be appended to existing	
	flags if necessary.	

The following command file excerpt illustrates how time series can be limited to rights prior to writing the StateMod time series file:

```
Step 8 - fill historical diversion using pattern approach
FillDiversionHistoricalTSMonthlyPattern(ID="36*",PatternID="09034500")
...similar commands omitted...
#
    Step 9 - Fill remaining missing with month average
FillDiversionHistoricalTSMonthlyAverage(ID="*")
#
   Step 10 - Limit filled diversion to water rights. Exceptions include structure
#
              receiving significant reservoir supply, carrier structures, etc.
LimitDiversionHistoricalTSMonthlyToRights(InputFile="..\statemod\cm2005.ddr",
 ID="*",IgnoreID="954683,952001,950010,950011")
#
   Step 11 - sort structures and create historical diversion file
SortDiversionHistoricalTSMonthly(Order=Ascending)
WriteDiversionHistoricalTSMonthlyToStateMod(OutputFile="..\StateMod\cm2005.ddh")
  Step 12 - update capacities and create final direct diversion station file
#
SetDiversionStationCapacitiesFromTS(ID="*")
WriteDiversionStationsToStateMod(OutputFile="..\statemod\cm2005.dds")
# Check the results.
CheckDiversionHistoricalTSMonthly(ID="*")
WriteCheckFile(OutputFile="ddh.commands.StateDMI.check.html")
```
